**Flow control** — X-ON/X-OFF, RTS/CTS, ENQ/ACK (HP)

**Diagnostics** — local or remote loop, auto test

**Indicator lights** — 10 LED's: 3 for speeds, 1 send, 1 receive, carrier, off the hook, terminal ready, correction of error and fax

**DRG approval** — 95058F

### Overview

The range of **MultiModemZDX™** modems is especially designed to offer to the PC or Macintosh® user a first class service for transmitting data or faxes.

When creating this range particular attention was given to details essential in the eyes of users either working from home or the office.

The various models in the MultiModemZDX range vary depending on their speed. MDM0033 conforms to the V.34 standards of the UIT-TSS and is available in PC and Macintosh versions.

MDM0033 is also fitted with a circuit to detect multi-frequencies (DTMF) which when a call is received enables it to recognise the difference between a fax call and data transmission. This device works on the basis of "virtual modem" control and allows any data transmission or fax software under Windows™ to be initialised automatically and calls to be handled without the user having to intervene.

The characteristics of the MultiModemZDX are as follows:

- Non-volatile memory for the modem settings and numbers in the memory
- Automatic dialing of numbers
- Diagnostics
- Remote configuration
- Help screens and total compatibility with AT commands
- Ten indicator lights continually indicate the status and activity of your connection
