## Buffered Data Broadcast

## FEDERAL COMMUNICATIONS COMMISSION RadIO FREQUENCY INTERFERENCE STATEMENT

This equipment generates, uses, and can radiate radio frequency energy and if not installed and used properly, that is, in strict accordance with the manufacturer's instructions, may cause interference to radio communication. It has been tested and found to comply with the limits for a Class A computing device in accordance with the specifications in Subpart J of Part 15 of FCC rules, which are designed to provide reasonable protection against such interference when the equipment is operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference, in which case the user at his own expense will be required to take whatever measures may be necessary to correct the interference.

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This digital apparatus does not exceed the Class A limits for Radio noise emission from digital apparatus set out in the Radio Interference Regulation of Industry Canada.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le Règlement sur le brouillage radioélectrique édicté par lIndustrie Canada.

## C

This product is CE certified. This certificate indicates that the product is suitable for use in commercial and light industrial environments as defined in EN 50081-1:1992.

## NOTE

Shielded interface cables must be used with this product. Call Technical Support at 724-746-5500 for guidance in choosing cables.

## 1. Specifications

Interface - Asynchronous
RS-232/V. 24
Connectors - (5) DB25S (4-Port model, part number TL160A-R2) (4) DB25S (4-Port expansion card, part number TL160-C)

Pins Supported -

| Pin \# | Name |
| :--- | :--- |
| 1 | Frame Ground |
| 2 | Transmit Data |
| 3 | Receive Data |
| 4 | Request To Send |
| 5 | Clear To Send |
| 6 | Data Set Ready |
| 7 | Signal Ground |
| 8 | Received Line Signal Detector |
| 20 | Data Terminal Ready |
| 22 | Ring Indicator |

Data Rates - 110 to $19,200 \mathrm{bps}$ (each port individually selectable)

Memory - 32 K expandable to 64 K with the expansion IC (part number TL484)

Indicators - (1) Power LED, (9) Port activity LEDs

Power Supply - Wallmount
transformer, $115 \mathrm{VAC}, 60 \mathrm{~Hz}$, $175 \mathrm{~mA}, 20$ Watts or 230 VAC, $50 \mathrm{HZ}, 90 \mathrm{~mA}, 20$ watts

Dimensions - 2.3"H x 12.1"W x
11.2"D ( $5.8 \mathrm{~cm} \times 30.7 \mathrm{~cm} \mathrm{x}$ 28.4 cm )

Weight - 4-Port unit: 7.5 lb . $(3.4 \mathrm{~kg})$; 4-Port unit with expansion board: 8.1 lb . $(3.7 \mathrm{~kg})$; Wallmount power supply: $2.1 \mathrm{lb} .(0.95 \mathrm{~kg})$

Enclosure - Steel
Operating Temperature - $32^{\circ}$ to $113^{\circ} \mathrm{F}\left(0^{\circ}\right.$ to $45^{\circ} \mathrm{C}$ )

Storage Temperature - $-4^{\circ}$ to $158^{\circ} \mathrm{F}\left(-20^{\circ}\right.$ to $\left.70^{\circ} \mathrm{C}\right)$

Humidity - 0 to $95 \%$ noncondensing

## Mean Time Between Failures

(Ground Benign Environment) 4 -Port unit: 20,000 hours; 4-Port unit with expansion card: 16,000 hours

## 2. Introduction

The Buffered Data Broadcast receives asynchronous data from a host and distributes it to up to four devices-or eight, using the expansion card. The four or eight devices can also transmit data to the host.

The unit has an internal buffer that is dynamically allocated to the individual ports. If a slow device cannot accept data as quickly as the other devices, the Data Broadcast's internal buffer will adjust itself so that the Data Broadcast will keep outputting data. The channel ports can continue to receive information from the host (as long as the Buffered Data Broadcast has internal buffer available) and broadcast data to all, without being held up by a slower device.

Dynamic allocation means that a varying amount of buffer is given to each port as it needs it, as opposed to having a set size of buffer for each port. Additional buffer can be "shifted" to ports that are receiving information faster than they can transmit it out to another port(s). This allows the most efficient use of the buffer, thus increasing system throughput.

The dynamic allocation works in both directions-when a host is transmitting to the ports and when the ports are transmitting to the host. The ports transmit to the host one port at a time. If a port is transmitting to the host and another port tries to transmit to the host, the other port's data is buffered and its request to link to the host is placed in a queue. When the port that is sending information is done, the Buffered Data Broadcast then goes to the next port in the queue and sends all its information, then it goes to the next port in queue and sends that information. This procedure continues as long as there is information to be sent to the host.

You can also make a one-to-one link between a channel port and the master port when the channel port has data to send to the master port. When no channel port is linked to the master port, the master port's data will be broadcast to all channel ports.

Each port is individually configurable for word structure, baud rate, flow control, and DTE or DCE operation.

The standard Buffered Data Broadcast (Model TL160A) supports four slave devices and one master device. The unit has 32 K of RAM, with approximately 29.4 K devoted to buffering. You can expand your unit's channel port capacity and/ or RAM by acquiring the following items:

- 4-Port Expansion Board (Model TL160-C) —provides 4 additional input ports.
- RAM Upgrade (Model TL484)provides 32 K of additional RAM with 25.4 K additional bytes of buffer.

## 3. Installation

Installation consists of the following steps:

1. Setting the internal DIP switches (Section 3.1)
2. Setting the DTE/DCE shunt jumpers (Section 3.2)
3. Installing the expansion card (optional-Section 3.3).
4. Installing the RAM Upgrade integrated circuit chip (optional-Section 3.4).
5. Connecting devices to the ports and powering up after the switches and jumpers have been set (Section 3.5)

### 3.1 Setting the Internal DIP Switches

Remove the cover to access the DIP switches. You'll need a small Phillips head screwdriver. Six (6) screws attach the cover to the chassis, three on each side of the unit. Fig. 3-1 shows the location of the DIP switches on the standard unit (part number TL160A-R2), and Fig. 3-2 shows the location of the DIP switches on the 4-Port Expansion Card (part number TL160-C).

## CAUTION

Remove power from the Buffered Data Broadcast when changing the internal switch settings. Power on to activate the changes. While the Buffered Data Broadcast is reinitializing, no data can be processed.

### 3.1.1 Port Configuration DIP Switches

You can configure individual ports for the following options:

- Baud Rate
- Parity
- Data Bits per Word
- Flow Control
- Enable/Disable

The DIP switches that correspond to each port as follows:

On the standard 5-port board (as shown in Fig. 3-1):

| SWA - | Master Port 0 |
| :--- | :--- |
| SWB - | Channel Port 1 |
| SWC - | Channel Port 2 |
| SWD - | Channel Port 3 |
| SWE - | Channel Port 4 |

On the 4-port expansion board (as shown in Fig. 3-2):

| SWH - | Channel Port 5 |
| :--- | :--- |
| SWI - | Channel Port 6 |
| SWJ - | Channel Port 7 |
| SWK - | Channel Port 8 |

Table 3-1 gives the switch position settings for each Port DIP switch.

NOTE: If the unit is not using a port, disable it via switch position 8. If it is not disabled, the throughput of the Buffered Data Broadcast will slow down or stop.

| 2400 | ON | ON | OFF |  |  |  |  |  |
| 4800 | OFF | ON | OFF |  |  |  |  |  |
| 9600 | ON | OFF | OFF |  |  |  |  |  |
| 19,200 | OFF | OFF | OFF |  |  |  |  |  |
| PARITY |  |  |  |  |  |  |  |  |
| None |  |  |  | ON | ON |  |  |  |
| Even |  |  |  | OFF | ON |  |  |  |
| Odd |  |  |  | ON | OFF |  |  |  |
| None |  |  |  | OFF | OFF |  |  |  |
| DATA BITS PER WORD |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
| 8 |  |  |  |  |  | ON |  |  |
| 7 |  |  |  |  |  | OFF |  |  |
| FLOW CONTROL |  |  |  |  |  |  |  |  |
| Hardware |  |  |  |  |  |  |  |  |
| (DTR or CTS) |  |  |  |  |  |  | ON |  |
| Software |  |  |  |  |  |  | OFF |  |
| (X-ON/X-OFF) |  |  |  |  |  |  |  |  |
| One-to-one channel |  |  |  |  |  |  |  | ON |
| to Master Port link |  |  |  |  |  |  |  |  |
| Master port always |  |  |  |  |  |  |  | OFF |
| broadcast to all channel ports |  |  |  |  |  |  |  |  |

*NOTE: The Master port settings (SWA) are the same as the Channel port settings except for Switch 8. The Master port settings for Switch 8 are as follows:

ON-make a one-to-one link between a Channel port and the Master port when a Channel port has data to send to the Master port. When no Channel port is linked to the Master port, the Master port's data will be broadcast to all Channel ports.

OFF-the Master port will always broadcast to all Channel ports, even when a Channel port is sending data back to the Master port.

### 3.1.2 System Option Switches

Breaking A Channel-To-Master Port Link

You can break the link from the Channel port to the Master port using two different methods:

- Break Character
- Timeout Period

## Break Link Character

If you choose the Break Character method, the Break Character must be selected by switch F. The link is broken when the break character is transmitted to the host port from the Channel port (not when it is received by the Channel port). See Appendix A for the settings of switch F to select the Break Character.

NOTE: If the Break Character option is enabled and the Break Character is the "NULL" ( 00 hex) character, a break sequence (the break sequence is generated by pressing the "break" key on most keyboards) will still break the link.

## Data Traffic Timeout Period

You can set a timeout period via switches 1-4 of DIP switch G. The timeout period can range from 1 second to 60 minutes. When no data is received, buffered, or transmitted between the Channel port and the Master port for that specified period of time, the Buffered Data Broadcast will break the link. Table 3-3 gives the settings for DIP switch G.

## BUFFERED DAIA BROADCAST

Table 3-3. DIP Switch G Settings.

| SWITCH POSITION |  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| OPTION | $\mathbf{8}$ |  |  |  |  |  |  |  |
| DATA TRAFFIC |  |  |  |  |  |  |  |  |
| TIMEOUT PERIOD |  |  |  |  |  |  |  |  |
| DISABLED | ON | ON | ON | ON |  |  |  |  |
| 1 second | OFF | ON | ON | ON |  |  |  |  |
| 3 seconds | ON | OFF | ON | ON |  |  |  |  |
| 10 seconds | OFF | OFF | ON | ON |  |  |  |  |
| 15 seconds | ON | ON | OFF | ON |  |  |  |  |
| 25 seconds | OFF | ON | OFF | ON |  |  |  |  |
| 1 minute | ON | OFF | OFF | ON |  |  |  |  |
| 3 minutes | OFF | OFF | OFF | ON |  |  |  |  |
| 5 minutes | ON | ON | ON | OFF |  |  |  |  |
| 7 minutes | OFF | ON | ON | OFF |  |  |  |  |
| 10 minutes | ON | OFF | ON | OFF |  |  |  |  |
| 15 minutes | OFF | OFF | ON | OFF |  |  |  |  |
| 20 minutes | ON | ON | OFF | OFF |  |  |  |  |
| 30 minutes | OFF | ON | OFF | OFF |  |  |  |  |
| 45 minutes | ON | OFF | OFF | OFF |  |  |  |  |
| 60 minutes | OFF | OFF | OFF | OFF |  |  |  |  |
| SYSTEM |  |  |  |  |  |  |  |  |
| RECOVERY |  |  |  |  |  |  |  |  |
| TIMEOUT |  |  |  |  |  |  |  |  |
| Disabled |  |  |  |  | ON | ON | ON |  |
| 15 seconds |  |  |  |  | OFF | ON | ON |  |
| 1 minute |  |  |  |  | ON | OFF | ON |  |
| 5 minutes |  |  |  |  | OFF | OFF | ON |  |
| 20 minutes | ON | ON | OFF |  |  |  |  |  |
| 30 minutes | OFF | ON | OF | OFF |  |  |  |  |
| Position 8 must be | ON | OFF |  |  |  |  |  |  |

## System Recovery

DIP switch G also controls a System Recovery function. If a port stops the Buffered Data Broadcast from sending data (via the flow control method), and does not signal the Buffered Data Broadcast to resume transmission, the Buffered Data Broadcast's internal memory will be "locked up." One malfunctioning device could tie up a lot of memory and prevent transmission of data to the other devices. The Buffered Data Broadcast will recover when any port has been flow controlled off for a period of time selected via switch positions 5, 6, and 7 of DIP switch G. You can disable or set the recovery time from 15 seconds to one hour (see Table 3-2). The Buffered Data Broadcast will free up any locked memory in one of two ways:

- System Recovery Port with Hardware Flow Control: The data to be transmitted out this port will be electronically deleted and the internal memory will be cleared.
- System Recovery Port with Software Flow Control: The Buffered Data Broadcast will change its internal transmission status (X-ON) and begin transmitting the buffered data out this port.

### 3.2 DTE/DCE Jumper Settings

You can set each port for DTE or DCE operation. To do this, place the shunt jumper into the appropriate socket. The sockets for a particular port are located directly behind the port. See Fig. 3-1 and 3-2 for the location of the jumper sockets. See Table 3-4 for a comparison of DTE versus DCE signals.

## BUFFERED DATA BROADCAST

Table 3-4. DTE Versus DCE Signal Directions

| DATA BROADCAST <br> CONFIGURED AS |  | Signal Direction |
| :--- | :---: | :--- |
| DTE | DCE |  |
| TXD (2) | RXD (3) | Output from Buffered Data Broadcast |
| RXD (3) | TXD (2) | Input to Buffered Data Broadcast |
| RTS (4) | DCD (8) | Output from Buffered Data Broadcast |
| CTS (5) | DTR (20) | Input to Buffered Data Broadcast |
| N/A | DSR (6) | Output from Buffered Data Broadcast |
| DCD (8) | RTS (4) | Input to Buffered Data Broadcast |
| DTR (20) | CTS (5) | Output from Buffered Data Broadcast |
| RI (22) | N/A | Input to Buffered Data Broadcast |

### 3.3 Installing the Expansion Card

The 4-Port Expansion Card (part number TL160-C) includes the following hardware:

- 2 standoffs
- 8 screwlocks
- 1 screw

Follow the steps listed below and refer to Fig. 3-3 to install the 4-Port Expansion Card:

1. Disconnect power from the Buffered Data Broadcast.
2. Remove the six screws from the sides of the unit and the three screws from the rear panel. Lift the cover from the unit.
3. Remove the screw located near IC chip U23 on the main circuit board. Do not discard this screw.
4. Insert a spacer in the hole where the screw from step 3 was installed.
5. Insert the other spacer in the hole located near IC U20 on the main circuit board.
6. Line up the port connectors on the 4-Port Expansion Card with the holes in the back cover. Make sure the pin connector on the bottom of the 4-Port Expansion Card is aligned properly with the pin socket on the main circuit board. Carefully press the top pin connector into the lower pin socket.

## CAUTION

DO NOT FORCE THESE CONNECTORS TOGETHER. Excessive force may damage the pins. Realign the connectors and try again if the connectors do not fit together easily.
7. Install the eight screwlocks through the back panel into the holes of each port's RS-232 connector on the 4-Port Expansion Board.
8. Install the screw from step 3 through the 4-Port Expansion Board into either spacer.
9. Install the screw provided with the 4-Port Expansion Card through the 4-Port Expansion Board into the other spacer.
10. The 4-Port Expansion Board is now installed.
11. Replace the cover and screws that were removed in step 2.

## BUFFERED DAIA BROADCAST

Fig. 3-3. Installing the Expansion Card.

### 3.4 Installing the RAM Upgrade

Follow the steps below to install the RAM upgrade integrated circuit chip (part number TL484).

## CAUTION

The IC is susceptible to static discharge and could be permanently damaged if not handled properly. Do not remove the IC from its packing container until you are ready to use it. Discharge any static electricity from yourself before you begin the replacement procedure.

1. Disconnect power from the Buffered Data Broadcast.
2. Position the IC so that its notch is lined up with the notch in socket U6, as shown in Fig. 3-4.
3. Place the IC on top of the socket, making sure all of the pins are lined up with their respective receptacle holes.
4. Occasionally, the distance from one row of pins to the other row on the new IC may be wider than the distance between the rows in the socket. If this is the case, lay the IC on its side and on top of a flat surface with the pins facing toward you. Gently press down on the IC, bending all of the pins slightly inward. This will decrease the distance between the rows of pins and allow the IC to be inserted in the socket.
5. Gently press the IC into the socket. Continue to press downward on the IC until it is fully seated.

The IC is now installed and ready for operation.

## BUFFERED DATA BROADCAST

Fig. 3-4. Integrated Circuit and Socket Orientation.
6. If the IC does not function correctly, remove the IC as described below:
a. Insert a small screwdriver between the IC and its socket.
b. Very gently pry one end of the IC partially up from the socket.
c. Insert the screwdriver at the other end of the IC and very gently pry that end of the IC partially up from the socket.
d. Continue to alternately pry one end, and then the other, up from the socket until the IC is free.
7. Check for bent pins or any other physical damage. If a pin is bent, straighten the pin with a small screwdriver or pliers and then reinsert the IC.

### 3.5 Connecting Devices to Channel and Master Ports

Once you have configured the internal switches (Sections 3.1 and 3.2) and jumpers, you are ready to connect your devices to the Buffered Data Broadcast.

1. Verify that the power-supply connector is properly attached to the 4-pin male connector on the Buffered Data Broadcast printed circuit board assembly.
2. Position the unit's cover back in place.
3. Connect the channel device cables to Channel Ports 1-4 (or $1-8$ ) of the Buffered Data Broadcast.
4. Connect the operator console cable to Master Port 0 of the Buffered Data Broadcast.
5. Plug the wall mount power supply into a suitable outlet.

### 3.6 Front-Panel Indicators

Ten LEDs are located on the unit's front panel: 9 port LEDs and 1 Power LED.

The POWER LED will be lit when power is present.

The Port Status LEDs will be flashing when data is passing through the corresponding port. If the LED is lit solid, a buffer overflow or a system recovery timeout has occurred at that port. If this occurs, make sure the flow-control options are set correctly and be sure the device connected to that port is powered on.

## BUFFERED DATA BROADCAST

## Appendix: Switch F Settings

This appendix lists all Break
Characters that you can set via switch
F. If the Break Character option is enabled and the Break Character is the "NUL" (00 hex) character, a break sequence (the break sequence is generated by pressing the "break" key on most keyboards) will also break the link.

The characters in the extended ASCII range (indicated by an *) may vary according to your equipment. Therefore, the character for these
switch settings is not listed. A " $\wedge$ " symbol means that you should press the control key and at the same time press the key for the character that follows the " $\wedge$ ". ASCII control names are indicated within parentheses ().

Parity and word structure will not affect these switch settings if you configure each port correctly for its options (for example, if you are running 7 bits per word, set your port for 7 bits, not 8, and make sure switch position 8 of switch F is OFF ).

Table A-1. Switch F Settings.

| BREAK LINK CHARACTER |  |  | SWITCH POSITION |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
